Guardian Quick Start

Guardian is a quality gate for AI writing. It reads what your AI produced before you rely on it, the way an editor reads a draft before it prints.

3	1	0
modes, one default	gate on every deliverable	changes to how you work

At a glance

What you get	What it means
Three modes	Off, Monitor, Enforce. Monitor is the default and runs light.
A gate on deliverables	Documents, reports, and emails get checked before they reach you.

What you get	What it means
No new workflow	Keep prompting the way you already do. Guardian rides along.
Claims pushed toward sources	Assertions get traced back to evidence instead of asserted.

What Guardian is

Your AI still writes the answer. Guardian reviews that answer before it reaches you. It clears the most common tells of machine writing, strengthens claims by pushing them back toward their sources, keeps numbers honest (ranges instead of single guesses when the truth is a range), and holds every piece of work to one consistent standard.

> **Where the line is.** No tool can promise that a document reads as human to every reader or every detector, and Guardian does not claim that. It aims at something narrower and more useful: work that reads like a person wrote it, with claims that hold up when somebody checks.

What Guardian is not

Guardian does not change what your AI knows, and it does not write for you. It shapes what comes out and raises the effort that goes in: the AI checks sources harder, vets what it cites, and takes the second pass it would otherwise skip, which is where the more accurate detail comes from.

Why it matters

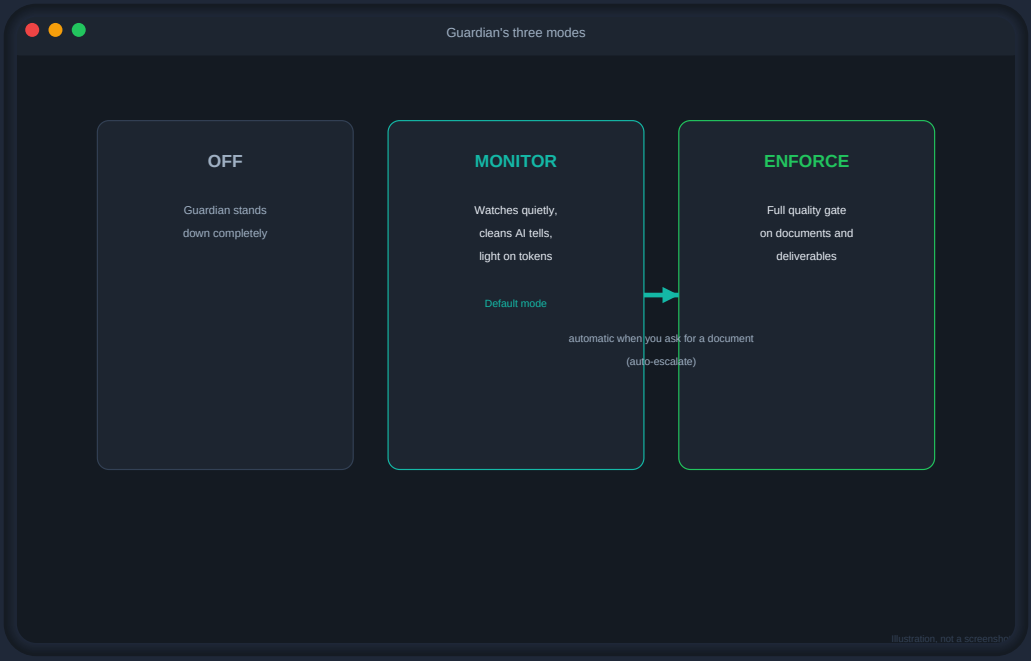

Work that leaves your desk reads like a person wrote it, not like a model filled a template. Claims trace to sources. Documents carry a pass score from a real checker instead of a hope. The polish holds whether you wrote one email today or forty.

Before	With Guardian
You reread every draft hunting for the machine-sounding lines.	The obvious tells are gone before you open the file.
Numbers arrive as confident single figures.	Variable numbers arrive as ranges, with the edges shown.
Quality depends on which day it is.	One standard applies to the first draft and the fortieth.

Before	With Guardian
Sources are whatever the model remembered.	Claims get checked against what actually supports them.

How to use it

Work exactly as you already do and ask for what you need in plain language. Guardian rides along in one of three modes:

The three modes

- **Monitor**, the default: Guardian watches quietly, clears the machine-writing patterns it catches, and flags what it cannot fix on its own. It runs light on purpose; watching costs a fraction of full checking, which keeps your usage bill down.
- **Enforce**: the full gate. Every document runs through the checker and gets corrected until it passes.
- **Off**: Guardian stands down entirely.

Auto-escalate, the part that makes it effortless

The moment you ask for a deliverable (a document, a report, an email, a spreadsheet), Guardian steps itself up from Monitor to Enforce for that work, gates the result, and settles back when the work is done. You never flip a switch. That is the efficiency design: light monitoring all day, full enforcement exactly when the output matters.

> *Light monitoring all day. Full enforcement exactly when the output matters. You never flip a switch.*

Tip. None of this needs remembering. If you want the full gate on everything for a while, say "Guardian ENFORCE" and it stays there until you say otherwise.

First questions

Question	Short answer
Does it slow my AI down?	Monitor adds very little. Enforce adds a checking pass on deliverables, which is where you want the time spent.
Will it change my meaning?	It edits for pattern, evidence, and clarity. Your content and your decisions stay yours.
Do I need a license key?	Not to start. The free Scout tier runs without one. Paid tiers add agents and vault features.
What if I disagree with an edit?	Say so in the conversation. Guardian is a gate, not a lock; you keep the final call.
Where do I go when something breaks?	Open the troubleshooting guide. Every fix in it is a restart, a click, or a re-download.

Try it today

Say this	What happens
"Draft a one-page summary of our Tuesday meeting."	Guardian escalates on its own, gates the draft, and hands you a clean one.
"Guardian status"	Reports your tier and the mode you are currently in.
"Guardian ENFORCE"	Holds every reply to full enforcement until you say otherwise.
"Guardian Off"	Stands Guardian down for the rest of the conversation.

What the first week looks like. Most people change nothing about how they work and notice the difference in the output: fewer stock phrases, numbers that admit their range, and claims that point at something. If a document matters, ask for it as a document and let auto-escalate do the rest.

Next

- Not installed yet? The install guide takes about two minutes.
- Something not working? The troubleshooting pages cover every reported install problem.
- Ask "Guardian status" in any conversation to see your mode and tier.
